

South Fork Initiative

\$300,000 annually

Why the South Fork?

Water management on the South Fork Snake River can directly affect streamflow in the Henry's Fork. The South Fork Initiative (SFI) will provide the opportunity to influence broad-scale water management for the benefit of the Henry's Fork and the South Fork, and maintain a healthy South Fork fishery to help disperse fishing pressure and ensure great fishing opportunities on both rivers.

Building Partnerships

HFF's approach to conservation has always begun with collaboration. There is a great deal of knowledge, expertise, and conservation effort already underway on the South Fork, so connecting organizations and agencies with anglers through outreach and communications is a crucial first step in developing a unified voice for the South Fork.

Water Quality and Habitat Monitoring

South Fork anglers have concerns about fluctuations in flows, macroinvertebrates and fish populations, summer water temperatures, and fish habitat. HFF has the experience and capacity to help establish time-tested water quality, macroinvertebrate, and habitat monitoring to increase our understanding of the South Fork ecosystem.

Restoration Projects

Tactfully implemented restoration projects are an effective way to boost trout populations and the fishing experience. The SFI will collaborate with partners like IDFG to implement and quantify the effectiveness of restoration projects and management strategies in the South Fork Watershed.
